August 2024

Serge Mercier CPA
Vice President , Finance and Business Development
Produits Forestiers Arbec
Québec, Canada

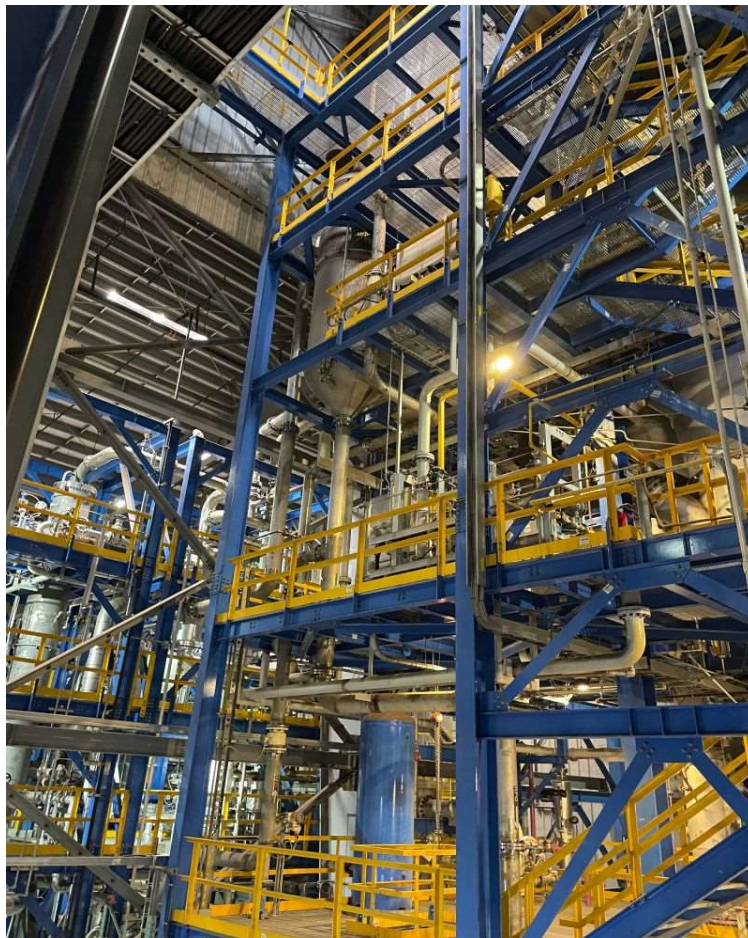

The Port-Cartier biofuel plant produced its 30 millionth litre this week using by-products from the adjacent sawmill. What an accomplishment! Making renewable bio-fuel with wood chips! This plant is unique in North America.

Its production has reduced greenhouse gases by 48,000 tons of CO2 for our customers by eliminating the use of polluting fossil fuels.

Thank you to all our employees, managers, customers, partners and funding agencies who supported us in this innovative project.

At Arbec/Remabec, we are now continuing to transform the Quebec and Canadian forest industry through the construction of a biochar plant, next to the biofuel plant, with the help of Airex Energies and Groupe Suez, which is currently under construction and will start operating in early 2025.

We Quebecers can be proud of these projects. The world is watching us, let's rise to the occasion!
